

## How to import the drum libraries into the Maschine library properly.

To install you must import each main folder into the Maschine database.

So this means you must import both “DigDrums” and “Drums Injection” into the database. You are not required to import the individual sub-folders contained inside these folders, just the two main folders.

Follow this procedure below:

1. Unzip the collection and store it in the location of your choice, where you store it does not matter just put it in a place that you wish to have it located.
2. Browse to the folder through the disk tab, right click the folder, and select “Import to Library”.

3. This will bring up the import/edit screen at the bottom of the browser. No tags needed. Click OK

4. Maschine will import the sound files, with all the proper tags and bank names. Repeat steps 1-3 for the other folder.
5. Enjoy your new samples and kits!!
